645: Set Mismatch:

You have a set of integers `s`, which originally contains all the numbers from `1` to `n`. Unfortunately, due to an error, one of the numbers in `s` got duplicated to another number in the set, which results in the **repetition of one** number and the **loss of another** number.

You are given an integer array `nums` representing the data status of this set after the error.

Find the number that occurs twice and the number that is missing, and return *them in the form of an array*.

Example 1:

```
Input: nums = [1,2,2,4]
Output: [2,3]
```

Example 2:

```
Input: nums = [1,1]
Output: [1,2]
```

```
class Solution:
    def findErrorNums(self, nums: List[int]) -> List[int]:
        seen = set()
        dup = -1
        n = len(nums)
        for x in nums:
            if x in seen:
                dup = x
            else:
                seen.add(x)
```

```
        missing = n * (n+1) // 2 - sum(seen)
        return [dup,missing]
```
