

383. Ransom Note:

Given two strings `ransomNote` and `magazine`, return `true` if `ransomNote` can be constructed by using the letters from `magazine` and `false` otherwise.

Each letter in `magazine` can only be used once in `ransomNote`.

Example 1:

```
Input: ransomNote = "a", magazine = "b"
Output: false
```

Example 2:

```
Input: ransomNote = "aa", magazine = "ab"
Output: false
```

Example 3:

```
Input: ransomNote = "aa", magazine = "aab"
Output: true
```

Constraints:

- `1 <= ransomNote.length, magazine.length <= 105`
- `ransomNote` and `magazine` consist of lowercase English letters.

Solution: time = $O(n)$ and space = $O(1)$

```
class Solution:
    def canConstruct(self, ransomNote: str, magazine: str) -> bool:
        ans = {}
        for i in magazine:
            if i in ans:
                ans[i] += 1
```

```
        else:
            ans[i] = 1

    for c in ransomNote:
        if c not in ans:
            return False
        elif ans[c] == 1:
            del ans[c]
        else:
            ans[c] -= 1
    return True
```
