

350. Intersection of Two arrays 2:

Given two integer arrays `nums1` and `nums2`, return *an array of their intersection*. Each element in the result must appear as many times as it shows in both arrays and you may return the result in **any order**.

Example 1:

```
Input: nums1 = [1,2,2,1], nums2 = [2,2]
Output: [2,2]
```

Example 2:

```
Input: nums1 = [4,9,5], nums2 = [9,4,9,8,4]
Output: [4,9]
Explanation: [9,4] is also accepted.
```

Constraints:

- `1 <= nums1.length, nums2.length <= 1000`
- `0 <= nums1[i], nums2[i] <= 1000`

Solution: Time = $O(n*n)$ and space = $O(\min(n,m))$

```
class Solution:
    def intersect(self, nums1: List[int], nums2: List[int]) -
> List[int]:
        res = []
        for i in nums1:
            if i in nums2:
                nums2.remove(i)
```

```
        res.append(i)  
    return res
```
